

Recipe of a planet

**Mix ingredients and boil to lavapoint.
Leave it in space 5-10 lightminutes
away from a suitable heatsource.**

**An average stars will do, if its fusion is still fresh.
Wait 1-2 billion years until the globe is stabilized.**

**Given plenty of time most planets change colour,
because the surface starts mutating. Normally
not a problem, but if things get out of control,
hurl a few rocks towards the planet
to restart the ecosphere.**

**Remember: Planets are safe when
handled as directed. However do not
exceed recommended evolution!**

Iron 34.6%

Oxygen 29.5%

Silicon 15.2%

Magnesium 12.7%

Nickel 2.4%

Sulfur 1.9%

Titanium 0.05%

Add rare elements according to your own taste...
